

Generators from England to the Ural

DS Spedition organizes supply of gas turbine generators for power plant construction in the Ural

With a lead time of only 10 days, the specialists of project logistics at DS Spedition were commissioned to transport and deliver a 2000 m³ of generator plus accessories from central England via St. Petersburg to Perm in the Ural.

Despite the limited time for preparation, loading commenced in Hull onto a specially chartered cargo ship 10 days after commissioning. After transshipping in St. Petersburg to special trucks suited for transport of the generators weighing up to 50 tons, direct delivery to the building site in the Ural could be undertaken. The abnormal width, height and weight demanded special planning of the route and implementation of transport means, which our on-site team optimized in such a way that delivery could be achieved at the exact planned arrival time.

Via the tracking system we could, of course, at all times inform the customer of the whereabouts of his shipment and of which station it would pass next. The customer made use of the direct communication link between himself and DS Spedition to update his own planning accordingly, ensuring that preparations for the intermediate storage of the extremely expensive generators were in place.

With its head office in Munich and branches in Berlin, Bergisch Gladbach, and Moscow DS Spedition provides a full service and is your preferred partner in all logistics and external supply chain issues. Whether transport by truck, combined freight transport, storage logistics or special logistics – DS Spedition has special units offering optimal solutions to its customers for each task.
